LANDSCAPE INTERVENTIONS

A brief introduction to landscape inserts

A sensory - informal garden set up with focus on textures, colours , smell, utility and volume rather than a traditional formal garden. This set up ensures colours and interest in the garden even in non flowering seasons. In the short span of 3 months, the garden has become a host for 3 varieties of butterflies and 2 bird nests apart from numerous other smaller fauna.
The 1000sqft garden also has a 350sqft lawn space to host guests and as an outdoor play area.

This project had an interior courtyard which the client wanted to develop as a tropical lush backdrop to their living area. Colorful bromeliads, lush bird nest ferns and tall brassias were included in the scheme to provide the visual relief.
The entire system was synced with an automated irrigation system which allowed the clients to travel freely with no concerns of the plants' wellbeing.

The outdoor space of the same project had some issues of water drainage which were addressed using French drains. Numerous flowering and fruit bearing trees are planted which would eventually form a mini orchard. Sufficient lighting and pause points are planned for the outdoor space to be an engaging extension to their dining area.

This home is situated in a gated community built on a mango orchard. The architecture of the house allows 3 generous courtyards with mango trees and an outdoor deck which totals upto 2200sqft of planting space.
A fairly homogenous planting is adopted here with pops of color and texture. The planting is tailored to the fast paced life of the home owners and will sustain with just regular watering. Ferns and lush foliage provides pleasant views from the interior spaces.

Ample seating and pause points is planned around the landscape scheme to consume the visual relief provided by the plants.
The terrace is an extension of the bar area. The monotonous brown flooring provided by the builder is accentuated by planning clever clusters of draught resistant plants. The views of neighboring terraces is blocked using creepers and trellises.

A small spill out area of an apartment was to be redesigned to create a fresh vibe. All plants were chosen to exude vibrance and color. Taller plants were planned to provide scale to the assemblage. These taller plants would also be ideal in reflecting light when they are lit from the bottom.

This landscape insert, created alongside the renovation of an 80-year-old home and existing natural features. The site's majestic mango tree and sprawling canopies from the road trees dictated the choice of plant species, with flowering shrubs incorporated wherever possible. A long creeper wall featuring 10 species of flowering plants ensures fragrant areas for most of the year. The inclusion of a small water body with fish and a solar fountain adds a soothing element, attracting a variety of birds and butterflies, and creating a serene oasis.
